

PRODUCT DATA SHEET

TENSION ROD HIGHLOAD

PRODUCT DESCRIPTION

The tension rod HighLoad is a sheet steel moulding that has been specially designed for the transmission of the enormously high tensile forces found in timber constructions. It was developed to meet the requirements of modern wooden buildings (complex hall buildings, multi-storey buildings). It is able to handle exceptionally high loads.

ADVANTAGES

- Short root face (150 mm)
- Ideal for anchoring cross-laminated timber elements (CLT)
- Indirect fixing due to an intermediate layer (e. g. OSB)
- For installation in concrete, wood and steel
- Optimised screw pattern and geometry for very high tensile capacities

MATERIAL

- Galvanised S355 construction steel
- Material thickness: 3 mm

Note

The tension rod HighLoad may only be used in combination with the pressure plate HighLoad (item no.: 954178).

CERTIFICATION

- European Technical Assessment ETA-19/0020

TECHNICAL INFORMATION

Side view

Front view

Characteristic Tensile Load Capacity $F_{1,k}$									
Timber/Concrete	Fixing in the support						Fixing in uncracked concrete		Steel
	Joining devices						Anchor rod (injection)	Bolt anchor	
	Anchor nails			Angle-bracket screw					
Dimensions [mm]	4 x 40	4 x 50	4 x 60	5 x 40	5 x 50	5 x 60	Ø 27	Ø 27	S355
Quantity [n]	81			81			1	1	
Char. tensile capacity [kN]	153,9	183,1	198,4	173,3	184,7	196,8	-	-	169,4

Wood strength class 350 kg/m³ char. Gross density.

The minimum distances between the connectors and the edges according to ECS must be complied with.

Note: The calculated values were carried out using the corresponding pressure plate.

TENSION ROD HIGHLOAD

INSTRUCTIONS FOR USE

The tension rods are positioned on the planking in the floor area to mark the drill hole. The tension rod is then put aside to drill and clean the hole, and finally the tension rod is glued in using injection mortar. Now the tension rod incl. pressure plate can be positioned and fastened to the stem or wooden element with WBS screws or anchor nails. Finally, the nut is screwed onto the anchor rod using the relevant torque. The connection can safely transfer tensile, suction and shearing forces into the tension rod via the screws and finally into the base plates via a dowel.

Edge and centre distances according to EC5 as well as the curing time and tightening torque of the concrete anchor must be observed.
